

Architecture and General Planning

Smart.
Sustainable.
Scandinavian.

Our Architecture

At Sweco, we know that the cities and communities of tomorrow will always look different from those of yesterday. Architecture creates the physical conditions that enable people to live together in an environment suited to their needs. Architecture is thus an integral part of society and influences many different aspects of human life. In line with our motto, “Transforming society together,” we are committed to the sustainable and positive development of society in collaboration with our clients and partners.

It is within this context, and with a clear focus on our clients’ needs, that we develop the architecture for our projects. Dedicated teams from all planning disciplines work hand in hand to create innovative buildings that offer genuine added value for clients, users, and society.

Our Architectural Philosophy

At Sweco, architecture is less defined by formal design, a particular architectural style, or the personal signature of a single architect. Rather, architecture emerges from the creative environment of a growing, diverse structure comprising different countries, locations, and design teams, and their intensive engagement with the design brief. Through our design methodology, we ensure an integrated and holistic design approach. The aim is to identify the individual and specific characteristics of a project and thereby give it its distinctiveness and uniqueness.

Sweco Germany is committed to its Scandinavian roots. Sweden serves as a model for a modern, balanced, and sustainable social order. Our close connection to nature shapes our planning culture. The 17 UN Sustainable Development Goals are our top priority.

One Stop Shop

At Sweco, we offer our clients a true one-stop shop. We provide feasibility studies, conceptual and detailed design services, and deliver planning services across all project phases and disciplines. We deliver solutions in the areas of buildings, infrastructure, water, energy, industry, and the environment. Depending on your needs, we provide our services as specialized planning, comprehensive planning, or as the central general planner.

We take a holistic approach and ensure that spatial planning, building design, structural systems, and technical equipment work in harmony. Through intelligent solutions, we seamlessly and naturally integrate considerations such as the environment, sustainability, room acoustics, sound insulation, fire protection, and safety into our building concepts. Through innovative concepts and approaches, we harmonize sustainability, cost-effectiveness, and appealing architecture. Whether it's new construction, remodeling, or renovation of buildings — we're here to support you.

Our Heritage

Our company is based on Gunnar Nordström's vision of a combined architecture and engineering firm. The idea is to take an integrated planning approach that brings together different perspectives to solve the challenges of our time. Under his leadership, the company he founded in 1958 grew into one of Sweden's leading engineering services and consulting firms. Sweco emerged in 1997 from the merger of his company with several major engineering and architecture firms. Today, with over 23,000 employees, Sweco is the largest planning firm in Europe, offering a wide range of services in the fields of architecture and building construction, the environment, infrastructure, energy, and industry.

Through our networked approach, we tap into the knowledge of our experts across all fields to provide solutions to a wide variety of challenges. We are also leaders in our BIM-based, integrated methodology, supported by a comprehensive software environment featuring specialized and AI tools. Continuous development, lifelong learning, and visionary work are the cornerstones of our practice.

We're taking action today for the world of tomorrow

At Sweco, the future is already here. Our architects are currently working on the interiors of a new hospital that will welcome its first patients in five years. Our transportation engineers are developing a new rail line that will take commuters to work in ten years. And our environmental planners are overseeing the permitting process for a new power line that will be essential to Germany's energy transition.

We make it easy for you

Do you have 1,000 decisions to make? One is enough! No matter where or how people's living conditions are to be improved, complex challenges arise first—we master these by connecting and constantly expanding our expertise. For integrated expertise across a wide range of disciplines and, above all, for sustainable solutions from a single source. So you only have to make one decision: choose Sweco.

Health

The walls of a hospital hold many emotions—hope, happiness, and joy, but also grief, worry, and pain. It is a place where people come for various reasons, often when they are at their most vulnerable and sensitive. Here, staff bear significant responsibility and a heavy workload. Therefore, designing safe and well-thought-out healthcare environments is of paramount importance to optimally support treatment and recovery. We create environments for medical and technological work at the highest level, for the healing process of patients, but also for difficult conversations and goodbyes.

We design hospitals at all levels of care, including tertiary care university hospitals, rehabilitation clinics, and specialized psychiatric clinics. We also develop senior living and nursing homes, facilities for people with dementia, and assisted living on behalf of public and private clients. We offer you all planning services from a single source and, if needed, supplement this with our specialized expertise in medical, laboratory, and building services engineering. We prepare feasibility studies and target plans and carry out all phases of the planning process.

Science

Science and research mean always staying ahead of the curve and continually breaking new ground. It is the brilliant minds, driven by curiosity and vision, who work tirelessly toward our shared future.

Our mission is to develop, with a clear vision, the ideal buildings and work environments that provide the best conditions for research. This architecture encompasses spaces for focused work, interdisciplinary teamwork, targeted exchange, and lively discourse, as well as chance encounters and collaborative activities. It is the specific requirements and constraints that constantly demand new solutions. Whether it's a new construction, an expansion, or a revitalization: Our buildings create an inspiring environment where ideas mature, innovations sprout, and collective thinking flourishes.

Education

“We do not learn for school, but for life,” said the philosopher Seneca as far back as the Roman Empire. Learning environments such as daycare centers, schools, and university lecture halls shape us as individuals and lay the groundwork for life and society. Furthermore, they should support the development of democratic and social issues such as inclusion, integration, and gender equality.

Human-centered design is of central importance to us. Based on the unique conditions of each project and the needs of learners, we design spaces that support the educational context and provide the best possible learning environment. In school construction in particular, we plan future-proof spaces by designing them flexibly so that they can be easily adapted to different teaching methods and learning activities. Our team of sustainability experts supports us in developing circular concepts for materials and energy. Through the long-term use and reuse of resources, construction and operating costs are minimized, the ecological footprint is reduced, and the future is secured.

Mobility

When you board a train, you may be looking forward to discovering a new city or traveling to a familiar place filled with memories and loved ones. It's not just the destination that matters, but also the journey there. Train stations, airports, and transportation hubs are places of identity: arrival and departure. Used by countless people, they must remain functional for a long time—sometimes even centuries.

We are experts in the planning and design of mobility infrastructure: from bicycle garages to train stations, arrival halls, airports, and bridges—always with a focus on holistic solutions. Using architecture as a tool, we can make travel more attractive and sustainable. We have identified five key words as our guiding principles: accessible, safe, sustainable, timeless, and beautiful.

Transportation infrastructure and travel environments are crucial pieces of the climate change puzzle. The entire sector faces significant changes. With attractive architecture and innovative solutions, we create conditions that ensure travel becomes a positive overall experience, whether the mode of transport is a bicycle or a high-speed train. A sustainable journey into the future!

Industry

In the industrial sector, experience and history are combined with innovation and modern solutions. Where this tradition is upheld, ideas emerge that lead to change and improvement. For over 60 years, we at Sweco have been building expertise in industrial architecture. Our focus is on putting the process at the center and creating conditions that simplify and streamline operations.

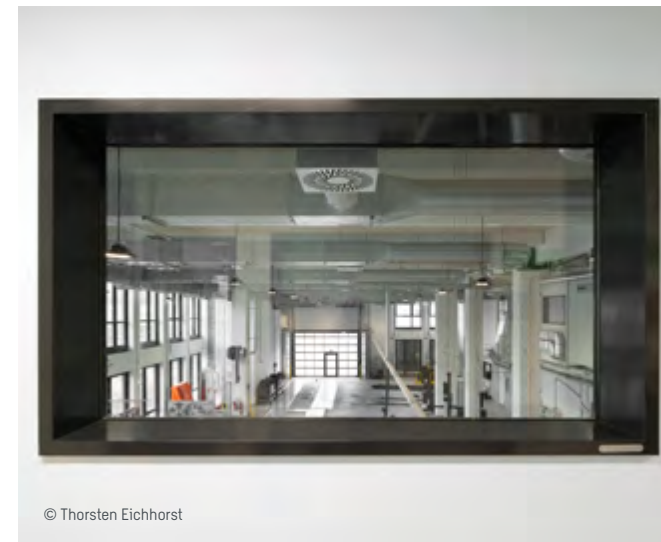

Industrial companies are multifaceted and constantly evolving. We make sure to continuously learn and improve in order to achieve the best solutions. Thanks to our comprehensive range of services, we handle both architectural design and overall or general planning. Our specialists in industrial construction and plant design ensure that your project is implemented efficiently and on schedule.

Whether it's manufacturing and maintenance facilities, mechanical engineering, or the pharmaceutical industry—our starting point is always listening. Because it is the clients who possess the expertise regarding their specific processes and needs. Through understanding, expertise, experience, and planning methodology, we find functional, aesthetic, and intelligent solutions for your project.

Administration

An office is a gathering place for individuals with diverse skills. They are the most important component of a thriving business. Employees need healthy, ergonomic environments where they feel comfortable, motivated, and able to work productively. At the same time, the office serves as the face of the company and offers the potential to support the brand.

We begin every project in close collaboration with our clients to understand their work processes and needs. This enables us to achieve tailored results. Sweco's architects possess comprehensive expertise, experience, and methodology. We combine modern work environments, interior design, and technology into an architectural design that takes sustainability and cost-effectiveness into account throughout a project's entire lifecycle. This generates efficiency, user satisfaction, and economic benefits for your project. In this way, we not only ensure a return on investment (ROI) but also promote sustainable growth.

Specialized Construction

There is a wide variety of building typologies. At Sweco, we have over 60 years of design experience and have developed a diverse range of buildings across various typologies. By leveraging the collective expertise of our specialists, we approach every project with the appropriate expertise and experience. We view design as an evolutionary process that constantly drives our own development.

For example, we design sophisticated hotels that take into account urban planning requirements, flexibility, cost-efficiency, and sustainability. Our interior designers contribute their Scandinavian-inspired design diversity.

We draw on our wealth of experience in security-related buildings when designing forensic clinics, correctional facilities, security control rooms, and command centers.

The design of grandstands, structural frameworks, or long-span roof structures goes hand in hand with our expertise as a general planner. Thanks to our Scandinavian roots, we have extensive experience in timber construction and circular construction methods. Sweco is your expert partner for every challenge.
